The Drink-Pack-Fun Beverage Backpack is a mobile dispensing system approved and complies technical requirements for European legislation.

All plastic and metal materials used in the manufacture of Drink-Pack-Fun Portable Drink Dispenser are approved by sanitary technical regulations for materials (EU-Regulation 1935/2004 and 2002/72/EG) destined to be in contact with food and drink.

Filling the Beverage Tank

The Drink-Pack-Fun may be used to serve all types of drink (beer, wine, soft drinks, juices, cocktails, tea, coffee milk, drink yoghurt, etc ...) carbonated or not, with the exception of undiluted spirits with high alcohol content. Drink-Pack-Fun is preferably useable for cold beverages!

Loading the Beverage Tank – Gravity Fed Operation

Remove the 5 liters (1.5 gallons) beverages tank fill with your carbonated/non-carbonated product. Please don't remove the hose/gun while refill the tanks and when dispense liquid. Put the tank lid back in place and make sure the lid fitted evenly. The black wing-nut with plug-on cone serves as balance pressure control valve for Gravity-Fed operation.

Place the beverage tank in the insulated backpack cover and place the hose/gun in the right position. You can fill the cup dispenser (integrated in shoulder strap) with cups with size 200 ml.

Before you start dispensing, put the backpack on correctly to ensure the best possible flow of drinks.

Operation with application Mini Air Pump

Remove the black wing nut with cone and put on the air pump instead (see figure below). For the required dispensing pressure, actuate the pump as often as necessary until resistance does not allow any more pumps. Now some drinking cups can be filled. Simply operate the pump as required.

Cleaning Drink-Pack-Fun

Before and after dispensing of beverages:

"Make sure the 5 liters (1.5 gallons) beverage tank and dispensing hose/gun is clean".

We can't stress this point enough. When the beverage tank is clean, then your product will always retain its original taste.

- 1) Remove the beverage tank from insulated backpack. Don't remove hose/gun while cleaning.
- 2) Rinse out the tank. Pour approx. 3 liters of warm tap water into the tank (do not use well water and never use a public bathroom). Add a commercial dish-wash detergent. Replace lid and shake the beverage tank for 10 seconds.
- 3) Allow the solution to remain in the tank for three additional minutes. Do a quick rinse of the container and dispensing hose & gun.
- 4) Dispense the liquid inside the tank giving you a good sanitation process. Make sure you empty the whole tank through the dispensing hose & gun.
- 5) Rinse beverage tank with warm tap water twice. Shake vigorously. If needed fill up for a third time and run clear water through dispensing hose & gun.
- 6) Cleaning and sanitation is complete. Allow the beverage tank to dry before replacing lid, if possible. Replace lid and store for next use.
